

CS480 – ARTIFICIAL INTELLIGENCE

FALL 2015

TOPIC: FIRST ORDER LOGIC REPRESENTATION
CHAPTER: 8
DATE: 10/14

Mustafa Bilgic

<http://www.cs.iit.edu/~mbilgic>

MOTIVATION

- Propositional logic is not very expressive
- Consider the following English sentence
 - “Squares adjacent to pits are breezy”
- How do you represent this in propositional logic?
 - $B_{1,1} \Leftrightarrow P_{1,2} \vee P_{2,1}$
 - $B_{2,1} \Leftrightarrow P_{1,1} \vee P_{2,2} \vee P_{3,1}$
 - $B_{3,1} \Leftrightarrow \dots$
 - \dots
 - $B_{1,2} \Leftrightarrow \dots$
 - \dots

FIRST-ORDER LOGIC (FOL)

- Built around *objects* and *relationships*
- Can express facts and rules about *some* or *all* of the objects in the universe
 - Enables to represent general rules

FIRST-ORDER LOGIC (FOL)

- First-order logic models the world in terms of
 - **Objects**, which are things with individual identities
 - **Relations** that hold among sets of objects and properties of objects that distinguish them from other objects
 - **Functions**, which are a subset of relations where there is only one “value” for any given “input”
- Examples:
 - **Objects**: Students, lectures, companies, cars ...
 - **Relations**: Brother-of, bigger-than, outside, part-of, has-color, occurs-after, owns, visits, precedes, ... and unary relations (properties): blue, oval, even, large, ...
 - **Functions**: father-of, best-friend, second-half, one-more-than ...

SYNTAX

1. Symbols
2. Terms
3. Atomic Sentences
4. Complex Sentences

SYMBOLS

- Quantifier $\rightarrow \forall \mid \exists$
- Constant $\rightarrow A \mid X_1 \mid \text{John} \mid \dots$
- Variable $\rightarrow a \mid x \mid s \mid \dots$
- Predicate $\rightarrow \text{True} \mid \text{False} \mid \text{Loves} \mid \text{SisterOf} \mid \dots$
- Function $\rightarrow \text{Mother} \mid \text{One-more-than} \mid \dots$

SENTENCE

- Sentence →

- AtomicSentence
- ComplexSentence

- AtomicSentence →

- Predicate
- Predicate(Term, ...)
- Term = Term

TERM

- Term →
 - Function(Term, ...)
 - Constant
 - Variable

COMPLEX SENTENCE

○ ComplexSentence \rightarrow

- \neg Sentence
- Sentence \wedge Sentence
- Sentence \vee Sentence
- Sentence \Rightarrow Sentence
- Sentence \Leftrightarrow Sentence
- Quantifier Variable, ... Sentence

ALL IN ONE PAGE

- Sentence \rightarrow AtomicSentence | ComplexSentence
- AtomicSentence \rightarrow Predicate | Predicate(Term, ...) | Term = Term
- ComplexSentence \rightarrow
 - \neg Sentence
 - Sentence \wedge Sentence
 - Sentence \vee Sentence
 - Sentence \Rightarrow Sentence
 - Sentence \Leftrightarrow Sentence
 - Quantifier Variable, ... Sentence
- Term \rightarrow Function(Term, ...) | Constant | Variable
- Quantifier $\rightarrow \forall \mid \exists$
- Constant $\rightarrow A \mid X_1 \mid \text{John} \mid \dots$
- Variable $\rightarrow a \mid x \mid s \mid \dots$
- Predicate $\rightarrow \text{True} \mid \text{False} \mid \text{Loves} \mid \text{SisterOf} \mid \dots$
- Function $\rightarrow \text{Mother} \mid \text{One-more-than} \mid \dots$
- Operator precedence: $\neg, =, \wedge, \vee, \Rightarrow, \Leftrightarrow$

QUANTIFIERS

○ Universal quantification

- $\forall x P(x)$ means that P holds for all values of x in the domain associated with that variable
- E.g., $\forall x \text{Dolphin}(x) \Rightarrow \text{Mammal}(x)$

○ Existential quantification

- $\exists x P(x)$ means that P holds for some value of x in the domain associated with that variable
- E.g., $\exists x \text{Mammal}(x) \wedge \text{LaysEggs}(x)$
- Permits one to make a statement about some object without naming it

UNIVERSAL QUANTIFICATION

- Universal quantifiers are often used with “implies” to form rules
 - $\forall x \text{ King}(x) \Rightarrow \text{Person}(x)$
- Beware of using \forall with \wedge :
 - $\forall x \text{ King}(x) \wedge \text{Person}(x)$
 - What's wrong with this sentence?

EXISTENTIAL QUANTIFICATION

- Existential quantifiers are often used with \wedge :
 - $\exists y \text{Crown}(y) \wedge \text{OnHead}(y, \text{John})$
- Beware of using \exists with \Rightarrow :
 - $\exists y \text{Crown}(y) \Rightarrow \text{OnHead}(y, \text{John})$
 - What's wrong with this sentence?

QUANTIFIER SCOPE

- Switching the order of universal quantifiers *does not* change the meaning:
 - $\forall x \forall y P(x,y) \Leftrightarrow \forall y \forall x P(x,y)$
- Similarly, you can switch the order of existential quantifiers:
 - $\exists x \exists y P(x,y) \Leftrightarrow \exists y \exists x P(x,y)$
- Switching the order of universals and existential *does* change the meaning:
 - $\forall x \exists y \text{ Loves}(x,y)$
 - Everyone loves someone
 - $\exists y \forall x \text{ Loves}(x,y)$
 - Someone is loved by everyone

CONNECTIONS BETWEEN \forall AND \exists

- We can relate sentences involving \forall and \exists using

De Morgan's laws:

- $\forall x P(x) \Leftrightarrow \neg \exists x \neg P(x)$
 - For all x , $P(x)$ is true \Leftrightarrow It is not the case that there is an x where $P(x)$ is not true
- $\forall x \neg P(x) \Leftrightarrow \neg \exists x P(x)$
- $\neg \forall x P(x) \Leftrightarrow \exists x \neg P(x)$
- $\neg \forall x \neg P(x) \Leftrightarrow \exists x P(x)$

TRANSLATING ENGLISH INTO FOL

- All smart students are hard-working
 - $\forall x (\text{Smart}(x) \wedge \text{Student}(x)) \Rightarrow \text{HardWorking}(x)$
- No smart student is hard-working
 - $\neg \exists x \text{ Smart}(x) \wedge \text{Student}(x) \wedge \text{HardWorking}(x)$
 - $\forall x (\text{Smart}(x) \wedge \text{Student}(x)) \Rightarrow \neg \text{HardWorking}(x)$
 - Show that the two above are logically equivalent

NONE, AT LEAST ONE, AT MOST ONE, EXACTLY ONE

- Bill has no sister
 - $\neg \exists x \text{ SisterOf}(x, \text{Bill})$
- Bill has at least one sister (Bill has a sister)
 - $\exists x \text{ SisterOf}(x, \text{Bill})$
- Bill has at most one sister
 - $\forall x, y \text{ SisterOf}(x, \text{Bill}) \wedge \text{SisterOf}(y, \text{Bill}) \Rightarrow x=y$
- Bill has exactly one sister
 - $\exists x (\text{Sister}(x, \text{Bill}) \wedge \forall y (\text{Sister}(y, \text{Bill}) \Rightarrow x=y))$
- Bill has at least two sisters
 - $\exists x, y \text{ SisterOf}(x, \text{Bill}) \wedge \text{SisterOf}(y, \text{Bill}) \wedge \neg(x=y)$
